

Performance Testing

Date: 30 September 2026 Team ID: MKU201AutoTicket

Project Name	Auto ticket classification using Flow designer
Maximum Marks	5 Marks

Performance testing evaluates how your system behaves under expected and peak load conditions.

For this project, the supplied evidence shows a ServiceNow Flow Designer workflow that classifies incident records according to category conditions. The attached screenshots do not contain measured load-test timings, throughput, CPU, memory, or error-rate results; therefore those values are marked as not measured rather than invented.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow Flow Designer / ServiceNow instance. No dedicated load-testing tool output was supplied.
Type of Testing	Workflow execution / functional validation. Performance-load metrics: not measured in the supplied evidence.
Target Module / API	Incident Workflow table and the "Auto Classify School IT Tickets Final" Flow Designer flow.
Test Environment	ServiceNow Developer instance (as shown in the supplied screenshots).
Test Date	30 September 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Create an incident with category = SD and subcategory = WiFi Network.	N/A	Not recorded	Flow identifies the WiFi Network condition and updates the incident record as configured.
2	Create an incident with category = SD and subcategory = Project or Hardware.	N/A	Not recorded	Flow enters the corresponding Else If branch and applies the configured record update.
3	Create an incident with category = SD and subcategory = Forgot password.	N/A	Not recorded	Flow enters the Forgot password branch and applies the configured record update.
4	Create an incident that does not match the listed conditions.	N/A	Not recorded	Flow follows the remaining configured path without an incorrect category match.

Step 3: Performance Test Results

S.N o	Metric	Target Value	Actual Value	Status	Remarks
1	Response Time (Avg)	< 2 seconds	Not measured	Not evaluated	No response-time measurements were supplied.
2	Response Time (Max)	< 5 seconds	Not measured	Not evaluated	No maximum response-time measurement was supplied.
3	Throughput (Req/sec)	—	Not measured	Not evaluated	No load-test request-rate result was supplied.
4	Error Rate	< 1%	Not measured	Not evaluated	No error-rate report was supplied.
5	CPU Utilization	< 80%	Not measured	Not evaluated	No server CPU monitoring result was supplied.
6	Memory Utilization	< 80%	Not measured	Not evaluated	No server memory monitoring result was supplied.

Step 4: Observations & Analysis

1. The supplied screenshots show a ServiceNow table named “Incident Workflow” and a Flow Designer flow titled “Auto Classify School IT Tickets Final.”
2. The flow is triggered when an Incident Workflow record is created and contains conditional branches for WiFi Network, Project or Hardware, and Forgot password scenarios.
3. The flow includes record-update actions after matching a condition, demonstrating that the classification workflow is connected to record updates.
4. The supplied evidence does not show a dedicated performance-testing tool report or measured performance metrics. A numerical pass/fail performance conclusion therefore cannot be derived from the supplied material.

Step 5: Screenshots / Evidence

The following screenshots are the supplied project evidence and are included without altering their content.

Evidence 1

Evidence 2

The screenshot shows the DevExpress Form Designer interface. The top bar indicates the project is 'Form Design'. The left sidebar has a 'Field Types' pane with a tree view showing categories: Currency, Data Structure, Dynamic Attribute Store, FX Currency, FX Address (Validated PVA, PVA), and Reference. The main workspace displays the 'Form Design' view for a form titled 'Incident Workflow [x_incident_workflow]'. A list of fields is shown, each with an icon, a name, and a 'Columns' button. The fields are: Color (Color icon), Category (Category icon), Sub category (Category icon), Short Description (Text icon), Description (Text icon), State (Text icon), Assigned Group (Text icon), and Assigned to (Text icon). The 'Columns' button for the first field is set to 3.
