

Technology Stack

Date: 30.09.2026

Team ID: MKU201AutoTicket

Project Name: Auto ticket classification using Flow designer

Maximum Marks: 2 Marks

Define Your Technology Stack:

The project uses ServiceNow and its Flow Designer to automatically classify incident tickets based on ticket information and predefined conditions. The selected stack is focused on ServiceNow's built-in form, table, workflow, and update-set capabilities shown in the project materials.

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

The table below details the technologies chosen for each component of the architecture and their purpose.

Technology Stack Details

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side (e.g., React, Angular, HTML/CSS)	ServiceNow UI / Form Designer	Provides the incident form and user-facing fields such as Caller, Category, Sub category, Short Description, Description, State, Assigned Group, and Assigned to. Form Designer is used to arrange the fields for ticket entry and display.
2	Backend / Server-Side (e.g., Node.js, Python/Django, Java)	ServiceNow Flow Designer	Implements the automation logic. The flow is triggered when an Incident Workflow record is created and uses conditions such as SD is WiFi/Network, SD is Project or Hardware, and SD is Forgot password to classify and update the record.
3	Database / Data Storage (e.g., MySQL, MongoDB, PostgreSQL)	ServiceNow Tables / Incident Workflow table	Stores ticket records and their fields. The project materials show a custom 'Incident Workflow' table and corresponding form fields used as the data source and target for the automation.
4	Cloud / Hosting / Deployment (e.g., AWS, Azure, Heroku, Docker)	ServiceNow Developer Instance	Provides the hosted ServiceNow environment in which the table, form, Flow Designer flow, and project configuration are created, tested, and run.
5	Version Control & CI/CD (e.g., GitHub, GitLab, Jenkins)	ServiceNow Update Sets	Captures configuration/customization changes made for the project so the ServiceNow configuration can be tracked and moved between instances when required. The project materials show a 'Project Update Set' containing customer updates.
6	Third-Party APIs / Other Tools (e.g., Stripe, Twilio, Google Maps)	ServiceNow Flow Designer tools and actions	Provides the trigger, conditional branches, and record-update actions used to automatically classify incident tickets and update the Incident Workflow record. No separate third-party API is specified in the supplied project materials.

Project-specific note: The supplied ServiceNow project screenshots show the Flow Designer flow "Auto Classify School IT Tickets Final", an Incident Workflow record trigger, conditional classification branches, record-update actions, Form Designer fields, and a Project Update Set.
