

CUSTOMER JOURNEY MAP

Auto Ticket Classification Using Flow Designer

Date: 30.09.2026 Team ID: MKU201AutoTicket Maximum Marks: 2 Marks

Customer Journey Map

The journey below represents the experience of an IT user who raises a school IT support ticket and follows it through automated classification and support routing in ServiceNow.

Journey Stage	1. Identify Issue	2. Create Ticket	3. Automated Classification	4. Record Update	5. Support Handling	6. Resolution / Closure
Customer Goal	Get help for an IT problem	Submit complete ticket details	Have the request recognized correctly	See the ticket categorized and routed	Receive support from the appropriate team	Get the issue resolved and ticket completed
Customer Action	Recognizes WiFi, hardware, project, password or similar issue	Enters Caller, Category, Sub category, Short Description and Description	Waits while the active Flow Designer automation evaluates the ticket	Reviews the updated ticket information when available	Works with IT Support and provides additional details if needed	Confirms the solution and closes/finishes the request
System Touchpoint	ServiceNow Incident Workflow form	ServiceNow UI / Form Designer	Flow Designer: Record Created trigger and conditions	Update Record actions on Incident Workflow	Assigned Group / Assigned to fields	Incident Workflow record and State
System Response	Provides a structured place to report the issue	Creates an Incident Workflow record	Checks conditions such as WiFi/Network, Project/Hardware, and Forgot Password	Writes classification/routing values back to the record	Support team can use the classified information for handling	Ticket status reflects the current workflow state
Customer Feeling / Need	Concerned; needs a clear way to ask for help	Wants an easy and complete submission process	Expects the correct category without manual effort	Wants clarity about where the ticket is going	Expects timely and relevant assistance	Wants confirmation that the issue is handled
Pain Point / Risk	Issue may be described inconsistently	Missing or unclear information can affect classification	A rule may not match a new ticket pattern	Incorrect rules could update the wrong classification	Routing may require further clarification	Closure depends on successful support handling
Improvement Opportunity	Provide clear category/subcategory choices	Use clear field labels and required information	Add and maintain classification conditions in Flow Designer	Standardize category and assignment values	Add assignment, notification and SLA automation	Add reporting and analytics for resolution trends

Project-specific journey summary: The IT user creates an Incident Workflow record. The active Flow Designer flow evaluates the ticket information through configured conditions, then uses Update Record actions to update classification and routing fields. The current project evidence includes WiFi/Network, Project/Hardware and Forgot Password classification branches.
