

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

2. DEMONSTRATION OF PROPOSED FEATURES

Date: 30.09.2026 | Team ID: MKU201AutoTicket

Project Title	AUTO TICKET CLASSIFICATION USING FLOW DESIGNER
Date	30.09.2026
Team ID	MKU201AutoTicket
Platform	ServiceNow - Flow Designer / Workflow Studio

1. Demonstration Purpose

The demonstration presents the proposed automation for classifying and routing support tickets through ServiceNow Flow Designer. It shows the configured record structure, trigger, conditional classification logic, record-update actions and resulting ticket information.

2. Proposed Features

Feature	Demonstration description
Custom incident record	Dedicated Incident Workflow record with Caller, Category, Sub category, Short Description, Description, State, Assigned Group and Assigned to fields.
Automatic flow trigger	The flow starts when a new Incident Workflow record is created.
Conditional classification	The flow evaluates ticket information using configured conditions such as network, project/hardware and forgot-password scenarios.
Automatic record update	Matching conditions trigger update actions that write the configured classification or assignment values.
Support routing	The workflow can route the classified ticket to the relevant support group and assignee.
Deployment evidence	The project update set and exported XML provide configuration/deployment evidence.

3. Demonstration Sequence

- Open the Incident Workflow form and show the available ticket fields.
- Create a sample ticket representing a known issue type.
- Show the active Flow Designer workflow and record-created trigger.
- Run the flow and show the applicable conditional branch.
- Verify the updated classification and assignment values.
- Repeat with another issue type to demonstrate different workflow actions.

4. Implementation Evidence

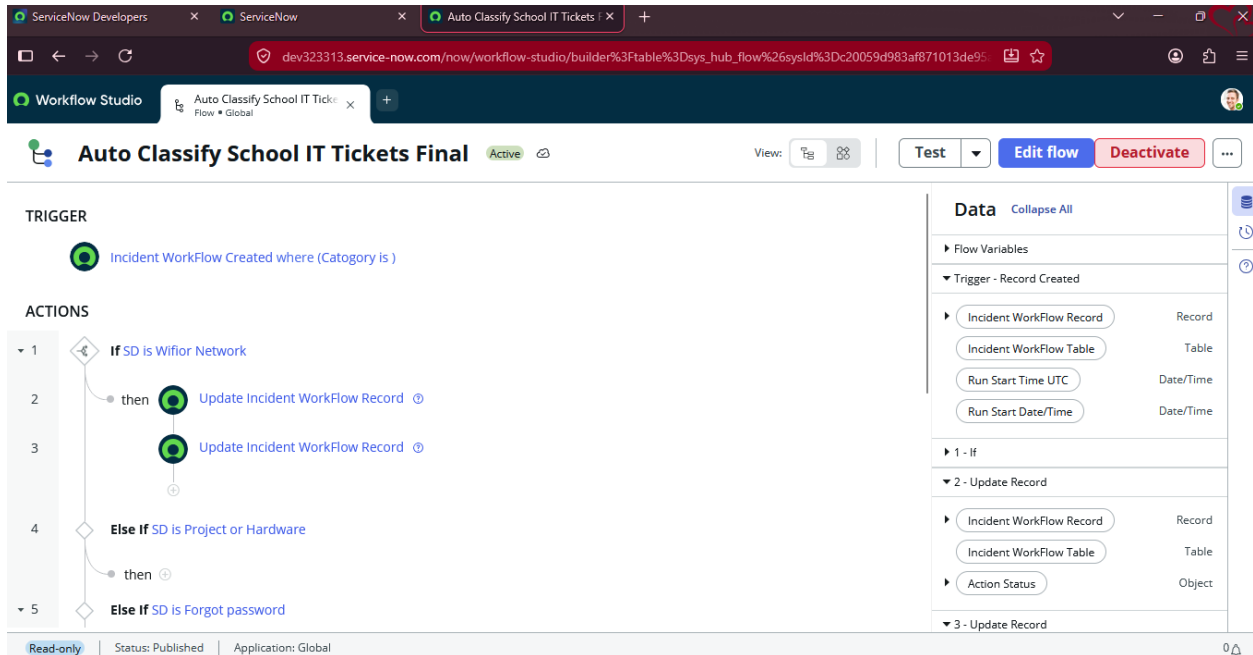

Figure 1. Flow Designer showing the active Auto Classify School IT Tickets workflow, record-created trigger and conditional actions.

The screenshot shows the ServiceNow Form Designer for the 'Incident Workflow' form. The form is titled 'Incident Workflow [u_incident_workflow]'. The fields included in the form are:

- Caller
- Category
- Sub category
- Short Description
- Description
- State
- Assigned Group
- Assigned to

The left-hand panel shows the 'Fields' section with a list of fields that will modify the database structure, including 'Currency', 'Data Structure', 'Dynamic Attribute Store', 'FX Currency', 'IP Address (Validated IPV4, IPV6)', and 'Reference'.
