

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

3. PROJECT DEMO PLANNING

Date: 30.09.2026 | Team ID: MKU201AutoTicket

Project Title	AUTO TICKET CLASSIFICATION USING FLOW DESIGNER
Date	30.09.2026
Team ID	MKU201AutoTicket
Platform	ServiceNow - Flow Designer / Workflow Studio

1. Demonstration Plan

The project demonstration is organized as a repeatable sequence that moves from the problem statement to implementation evidence and then to a live ticket-classification example. Each stage has a clear output so the workflow can be verified during the session.

2. Planned Demonstration Agenda

Stage	Activity	Evidence / Output
1. Introduction	Introduce title, objective and team ID.	Project overview
2. Data structure	Show Incident Workflow table and configured fields.	Form/table configuration
3. Flow trigger	Show how a record-created event starts the flow.	Workflow trigger
4. Classification logic	Explain IF / ELSE IF conditions and issue categories.	Decision branches
5. Automation	Demonstrate record-update and assignment actions.	Updated ticket
6. Validation	Run sample tickets and verify results.	Test outcomes
7. Closing	Summarize benefits and future enhancements.	Conclusion

3. Demo Readiness Checklist

- ☐ Flow is active/published and the required trigger is available.
- ☐ Sample ticket records are prepared for each classification scenario.
- ☐ Expected category, subcategory and assignment outcomes are documented.
- ☐ Screenshots and update-set/XML evidence are available as backup.
- ☐ The demonstration path has been rehearsed from ticket creation to final verification.

4. Backup Evidence

ServiceNow recommends creating custom tables in scoped applications. To learn more about creating scoped applications, click [here](#).

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More Info](#)

* Label: Incident Workflow
