

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

4. SCALABILITY & FUTURE PLAN

Date: 30.09.2026 | Team ID: MKU201AutoTicket

Project Title	AUTO TICKET CLASSIFICATION USING FLOW DESIGNER
Date	30.09.2026
Team ID	MKU201AutoTicket
Platform	ServiceNow – Flow Designer / Workflow Studio

1. Scalability Plan

The current solution uses Flow Designer conditions and record-update actions to classify tickets. The same approach can be extended by adding issue categories, detailed conditions, assignment groups, notifications, integrations and reporting without redesigning the complete ticket-management process.

2. Current-to-Future Expansion

Area	Current implementation	Future enhancement
Classification	Rule-based IF / ELSE IF conditions.	More categories, reusable decision logic and data-driven classification.
Assignment	Update record and route to configured support group/assignee.	Load balancing, skills-based routing and dynamic assignment.
Notifications	Can be triggered after classification/update.	Role-based alerts, escalation and ServiceNow notifications.
Analytics	Ticket records provide structured data.	Dashboards for category volume, priority, routing and resolution trends.
Integration	ServiceNow-native workflow.	Integration with email, chat, knowledge, asset and external IT systems.
Intelligence	Predefined rules.	NLP/ML-assisted classification with human review for uncertain cases.

3. Future Development Roadmap

- Phase 1 – Rule expansion: Add more ticket categories, subcategories, priorities and routing conditions.
- Phase 2 – Reusable automation: Standardize subflows/actions for common classification and notification logic.
- Phase 3 – Integration: Connect ticket intake and notifications with other service-management channels.
- Phase 4 – Analytics: Build dashboards for category volume, routing accuracy, processing time and unresolved tickets.
- Phase 5 – Intelligent assistance: Evaluate NLP/ML-based classification suggestions while retaining configurable controls and human review.

4. Long-Term Goal

The long-term goal is a maintainable ticket-automation solution that can handle a broader range of IT support scenarios while remaining configurable, traceable and easy to extend.

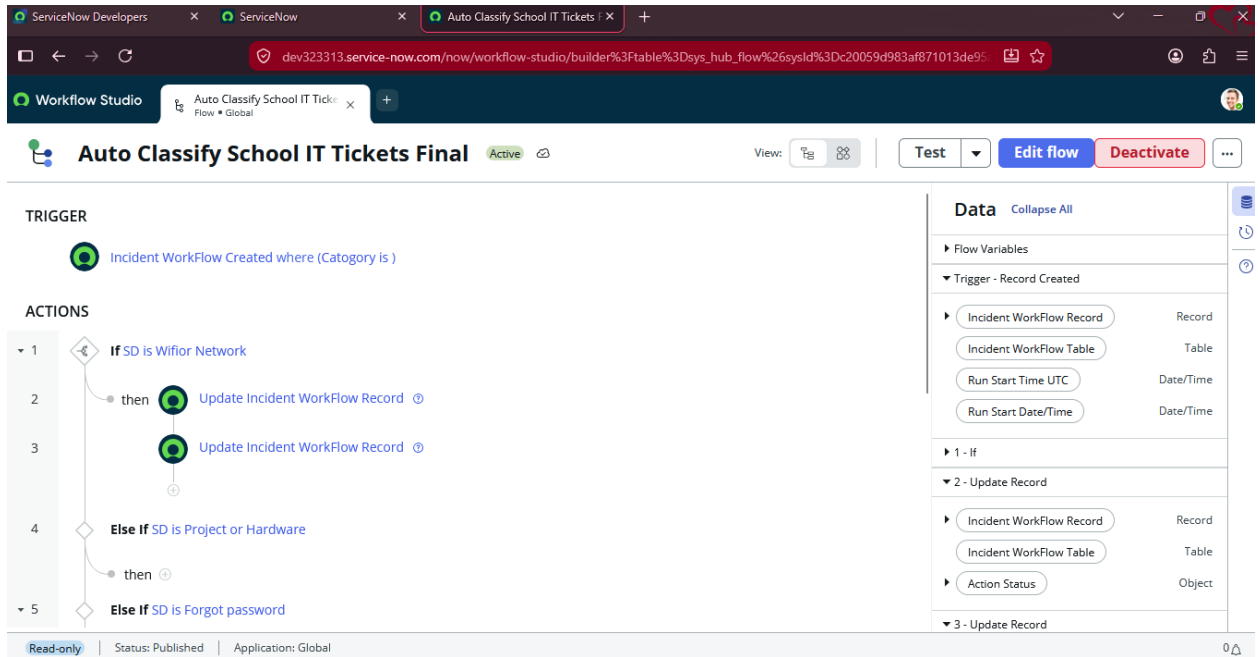

Figure 1. Current Flow Designer implementation provides the foundation for future workflow expansion.
